Game represented in UML Use Case Diagram.

(shows the relationship between actors and system functions, clarifying responsibilities and interactions)

Actors

Player

(interacts with game, login/signup, search, history)

Administrator

(manages user data, oversees system)

Email Service

(handles verification and password reset)

Use Cases

Play Train Puzzle

Login/Signup

Verify Email

Reset Password

Search Player Records/Puzzle Solutions

View/Delete Visit History

Monitor system and manage data

CONTEXT

Game represented in BPMN workflow.

The workflow consists of five main components:

1. User Registration/Login

– User submits credentials → System validates → Email verification triggered → Account activated

2. Gameplay Flow

– User starts Train Puzzle → Game logic executes → Results stored in database → Records updated

3. Search Service

– User enters query → API fetches results from database → Results displayed in UI

4. Visit History Tracking

– Each page visit logged → Stored in history table → User can view/delete history

5. Admin Oversight

– Admin dashboard → Access to aggregated player data → Audit logs maintained

Speaker: John, Tan Pak Long

CONTEXT

Speaker: John, Tan Pak Long

GOALS - FINAL CONCEPT

[HOME](#)[SERVICE](#)[ABOUT US](#)[CONTACT US](#)

Speaker: John, Tan Pak Long

We refined our ultimate goals as follows:

- Build a complete, full-stack interactive game website for a **smooth gaming experience** on various devices
- Provide **secure and reliable user services** (e.g. registration, login, email verification, password reset, etc.)
- Support **data management** and analysis (e.g. player game records, puzzle results, and access history)
- Achieve **team collaboration and agile development**
- Demonstrate **professional capabilities**

Frontend Goals

- Implement responsive design.
- Implement the game interface (tracks, trains, puzzle logic), menus, and player result display.
- Ensure the UI adapts to different devices.

Backend Goals

- Build an API service.
- Implement registration/login, email verification, password reset, and session management.
- Provide a search interface (player records, puzzle solutions).

GOALS -

FURTHER CODE IMPLEMENTATION GOALS (TECHNOLOGY DEPLOYMENT)

Data Goals

- Define user, game history, and access log schemas.
- Implement data storage, querying, and log tracing.
- Optimize query performance using indexes and caching.

Security Goals

- Protect user passwords using hash algorithms.
- Implement encrypted communication and secure sessions.
- Provide user privacy settings (such as deleting browsing history).

Deployment Goals

- Deploy the application.
- Ensure a smooth deployment by leveraging GitHub CI/CD automated workflows.
- Ensure the website is accessible online and supports multi-user concurrency.

SERVICES & DATA REQUIREMENTS

SERVICES

Authentication

- User accounts, email verification, password reset

Search

- Query player records and puzzle solutions

Visiting History

- Log visited pages with timestamps

Game

- Puzzle logic, scoring, difficulty progression / customization

DATA REQUIREMENTS

User Table

- accounts, credentials, verification status

Game Records

- scores, attempts

History Table

- visited URLs, timestamps

Puzzle Solutions

TASKS AND TOOLS

Overview - Tasks

Speaker: Bruce, Xu WuSiyuan

SYSTEM DESIGN

Define system architectures, create UI wireframes and database E-R diagrams.

IMPLEMENTATION

Build responsive UI, develop authentication and search APIs, design database schemas.

TESTING & DEPLOYMENT

Conduct unit testing and usability testing, deploy the application to a PHP-enabled cloud platform.

TASKS AND TOOLS

Overview - Tools

DEPLOYEMENT

We plan to deploy our work through either...

SUPPLEMENTS

GitHub for seamless automation, especially of its consistent environment provided by GitHub actions.

TASK DESCRIPTION

Front-end Interactive Design

Bruce and Collins are in charge of building a responsive User Interface for the puzzle game, including gameplay, menu and results.

A simulated puzzle board by Bruce.

TASK DISTRIBUTION

PAIR 11 - BACK-END DEVELOPMENT

[HOME](#)[SERVICE](#)[ABOUT US](#)[CONTACT US](#)

Speaker: Uriel Wuli

URIEL WULI

TAN PAK LONG,
JOHN

Responsible for implementing APIs for authentication, search and history tracking.

TASK DESCRIPTION

Back-end Development

Workflow Plan:

- Design an engaging, game-themed authentication interface utilizing HTML, CSS, and JavaScript to ensure a seamless and responsive user experience.
- Utilize PHP to develop server-side scripts that handle critical operations, including session management, secure password modification, and automated email dispatching.
- Establish a secure connection with the database system. All user passwords will be safeguarded using hashing algorithms to ensure data privacy and security.

Complete Security Lifecycle:

- Registration: Mandatory Email Verification.
- Data Storage: Passwords encrypted via Hashing.
- Authentication: Managed via Secure Sessions.
- Account Recovery: Secure Password Reset via email links.

A simple login/signup system by John and Uriel.

Page 20

WORK PROGRESS

Back-end Development

CORE INFRASTRUCTURE

Database (PHP + MySQL)

- Singleton connection
- User table as core

Mailer (PHPMailer)

- SMTP-based email
- Used for activation & password reset

Dependencies (JSON / Vendor)

- Manage external libraries
- Support email & security

Global Styling (CSS)

- Unified Brutalist UI
- Consistent design

USER REGISTRATION FLOW

Signup Page (HTML + JS)

- Collect user data
- Real-time validation

Process Signup (PHP)

- Store user as inactive
- Generate secure token
- Send activation email

Signup Success (HTML)

- Prompt user to check email

Activate Account (PHP)

- Validate token
- Activate account

WORK PROGRESS

Back-end Development

Search system

In Progress...

Waiting for database schema finalization

Depends on:

- User table structure
- Puzzle & result tables

TASK DISTRIBUTION

PAIR 11 - BACK-END DEVELOPMENT

[HOME](#)[SERVICE](#)[ABOUT US](#)[CONTACT US](#)

Speaker: Chen Joaquin Antonio

SEKI TOMOKI

CHEN JOAQUIN
ANTONIO

Responsible for managing the database system. (e.g. puzzle solutions, players and their records)

TASK DESCRIPTION

Database Management

Seki and Joaquin will be responsible for designing and implementing the core database system, including schemas, data operations, and audit logging.

Workflow Plan

- Define database schemas for core entities: User, PlayerProfile, GameRecord, and VisitLog, as shown in the class diagram.
- Implement game data operations: saving records, updating scores, retrieving profiles, and querying game history.
- Build the activity logging system to track user visits, including login IP, device info, and timestamps.
- Support user authentication and data queries, ensuring secure and efficient access to player and game data.

TASK DESCRIPTION

Database Management

This diagram details the secure login workflow for our platform:

- 1. **Request Submission:** The player enters credentials in the game UI, which sends a login request to the PHP backend.
- 2. **Database Lookup:** The backend retrieves the user’s account data, including password hash and verification status, from MySQL.
- 3. **Two-Step Validation:** The system first checks if the email is verified, then verifies the password using secure hashing.
- 4. **Activity Logging & Access:** Successful logins are recorded in visit_logs, and a session token is issued to grant the player access to the game.

WORK PROGRESS

Database Management

The core business database table structure design has been completed and successfully deployed to the cloud to support four core business scenarios:

USER

Supports the entire process of registration, login, email verification, and password reset to ensure account security.

GAME_RECORDS

Supports the entire process of registration, login, email verification, and password reset to ensure account security.

PLAYER_PROFILES

Links users and stores information such as nicknames, points, and game sessions, providing support for data statistics and presentation.

VISIT_LOGS

Records user login behaviors (compatible with IPv6), used for behavior tracing and security auditing.

WORK PROGRESS

Database Management

[HOME](#)[SERVICE](#)[ABOUT US](#)[CONTACT US](#)

Speaker: Chen Joaquin Antonio

Key Design Features

- **Foreign key association and cascading deletion:** Establish foreign key(such as user_id) relationships among all entities and maintain data consistency through the cascading deletion mechanism.
- **Password hash storage:** Hash the passwords before storing them to ensure the security of the credentials and match the verification logic in the login process.
- **Targeted index optimization:** Create indexes for frequently queried fields (such as scores, user history) to improve system performance.
- **Automated timestamp:** Utilize the automatic creation and update of timestamps to simplify the auditing tracking and data management processes.

CHALLENGES

integrating the game logic

secure user authentication.

-
-

cross-device responsiveness.

real-time history tracking

efficient search queries

OTHER POSSIBLE CHALLENGES

Team 02

As your system scales, how will your team design such that the system can handle mass user load while maintaining smoothness of the game?

A layered architecture will be applied to distribute request pressure. The front-end ensures reactive design and asynchronous requests while the back-end can be scaled up to maintain responsiveness user high concurrency.

OTHER POSSIBLE CHALLENGES

Team 05

How will you ensure fast search performance as the database grows?

We will use efficient indexing mechanisms and caching strategies. Also, when necessary, we will also separate player data from personal profiles.

DELIVERABLES

[HOME](#)[SERVICE](#)[ABOUT US](#)[CONTACT US](#)

Up to now, our deliverables for this project remain the same:

- Fully functional Train Puzzle Game
- Secure login/signup system with email verification
- Search service for records and solutions
- Visiting history and tracking
- Documentation (e.g. README, system design, user guide)
- Demo gameplay

CRITERIA OF SUCCESS

Responsive design, ensuring the game displays well on any device

Search function for player records and puzzle solutions, and clear visit logs.

Intuitive UI with smooth gameplay.

Secure authentication and password management.

Complete documentation and successful deployment.

EVALUATION

[HOME](#)[SERVICE](#)[ABOUT US](#)[CONTACT US](#)

Speaker: Collins, Chan Hio Tou

We are going to evaluate the application based on the following:

- **Content accuracy and relevance (35%)**
 - Does the project fully align with the proposal, with all features implemented correctly and relevant to course outcomes?
- **Technical implementation and functionality (35%)**
 - Does the application contain secure authentication, responsive design, search service, and history function, all running smoothly with no major bugs?
- **Design and user experience (20%)**
 - Is the interface intuitive, visually appealing? Is the game responsive across devices, with accessibility standards met? Is the game engaging and running smoothly?
- **Documentation completeness (10%)**
 - Does the project contain comprehensive documentation such as README, system architecture, E-R diagrams, user guide and demo visuals? Are they clear and professional?

PROJECT LEARNING

[HOME](#)[SERVICE](#)[ABOUT US](#)[CONTACT US](#)

Speaker: Collins, Chan Hio Tou

As an individual...

- Strengthen skills in full-stack development.
- Gain experience in implementing authentication, database design and responsive UI.
- Learn to integrate diverse components into one cohesive system.

As a team...

- Practice agile collaboration and task distribution.
- Improve communication and project management skills.
